

RM5096 Submersible Rain to Mains System

This Rainwater Harvesting System is the ideal solution for all of your garden watering needs. The pump is contained within the below ground or above ground slimline tank making it quiet when operating. Because this superior system is inside the tank it is out of sight therefore reducing the risk of damage by pets or a stray football. These systems can also be used to connect up to your toilets, laundry and hose taps to help you comply with local building and sustainable living regulations. The benefit to you of course is that you save money on increasing town / mains water costs when you use rain water for your amenities around your home.

CODE	DESCRIPTION	POWER		MAXIMUM		CABLE LENGTH	OUTLET
